Srivestas Research Paper
co-adaption neurons work together acheive combination
Dropouts
↳ Takes out one neron to see the training
A neuron must work with othe neurons and by itself
Bernollui distribution like flipping coin
↳ If 1 keep 0 drop neuron
Max norm Regularization
↳ make weights not expand as big
Large networks can overfit more but generalization still appears

Bayseian method is giving models higher preferonce, different models are diffrent neurons firing.
L2 Regularization
weights to stay small
L1
weights to become 0
Networks using dropout should be larger than equivalent networks
Restricted Boltzmon Machines
↳ Not forward passing
↳ Dropout works init
Gaussian Dropout: Randomly change how much each neuron affects eachother
